

I Have a New Symptom / My Symptoms Are Shifting

Alright, so your symptoms changed. Maybe something calmed down and something else got worse. Maybe something completely new showed up. So your brain now is like, all right, this is a, this is a new problem. We need to start a new investigation. This is a, a new thing to figure out, a new rabbit hole to go down.

I want you to notice that urge, because that's, that's the pattern, that's the the loop we're trying to break. This is what sensitized nervous systems do. Symptoms move and they shift and they swap places, and they get higher, and they get lower, and they show up in forms that you weren't expecting and forms that you're unfamiliar with.

I went through this. Physical symptoms would calm down, mental symptoms would spike. Then in reverse it would be one side of my body, then the other side of my body. Then something brand new would appear and I'd think, all right. This has gotta be a real problem and, and I wanna figure it out. Your brain wants you to research and to check and to get to the bottom of this.

It's trying to get your attention. And that is the trap here because if you go down that road, you get back in the cycle and you're then reacting to symptoms, feeding that alarm. And reinforcing to your nervous system, every sensation is an emergency and it gets really good at sending you the type of sensation that is going to make you go searching.

Of course, if something feels medically concerning, handle it like you would if you weren't dealing with all of this. Make an appointment, get it checked, and move on. That's different from the frantic loop of needing to figure something out right now. But if this is just your brain latching onto something new to spin out on, I wanna remind you the response is the same.

You don't engage, you don't get sucked in, you don't overanalyze. You let it be there and you keep living. If you need a reminder of why symptoms shift during this process, revisit lesson six. If you're tempted to start researching, revisit lesson two. Same response, different sensation.
